Payment Gateway

APPS

Smart Charging Road with wireless chargers.

Solar Panels would provide power to wireless charging coils under the road, also charge vehicles parked nearby on user's request.

Smart Roads would detect your car with RFID, to wirelessly charge your vehicle open app in vehicle to proceed.

Once the payment is received, charging starts for desired amount of time.

Report in case of accidents on the server with device ID to the state authority and notification send to the ambulance through MQTT(I am still working on it)

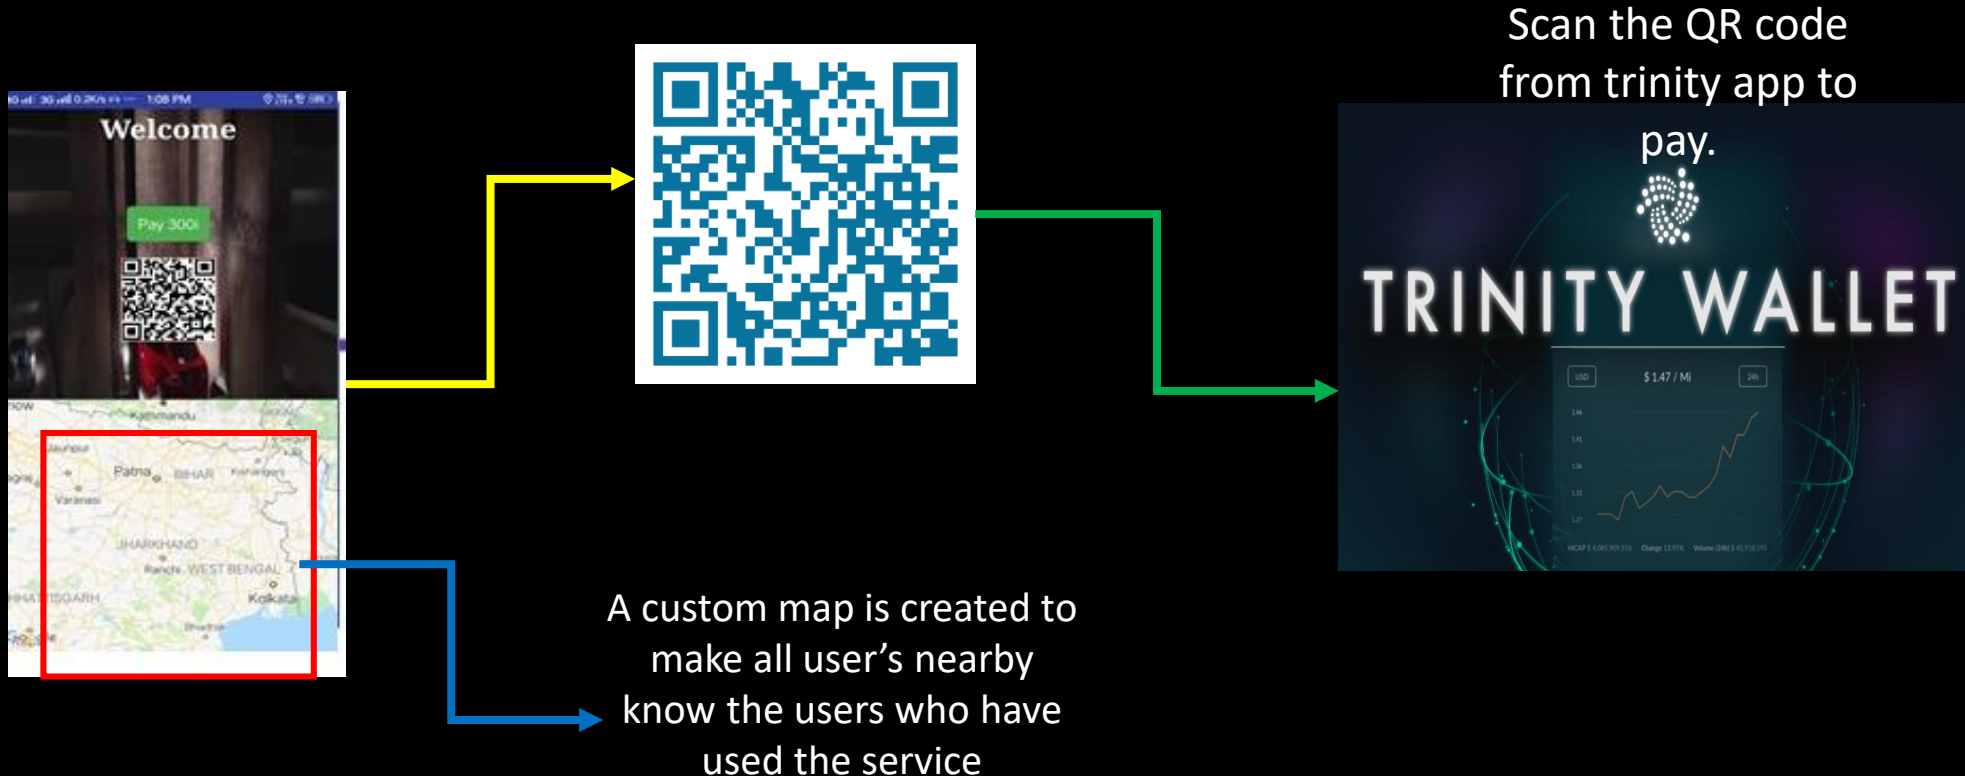

Cloud functions to get live status of the devices with location.

Sensor activity and electricity distribution for charging handled by Particle Argon. A digital ledger for keep record for vehicles passing on the road as a safety feature via RFID and webhooks.

Working

The user need to scan the QR code on his car app(after selecting the charge or exit option a QR code would be generated automatically) the user need to send the iotas from Trinity app and the particle Argon or Esp32 would read the request and check for successful transaction and do the charging or exit from traffic services.

Working

Intangible Benefits to customers:

- 1) Hassle free payments, records of their payments
- 2) Get rid of traffic congestions fast
- 3) No pollution
- 4) Efficient charging with
- 5) Get more insights about the nearby customers on your car app
- 6) More benefits to come in future
